

Traceability Note

From recovered PET bottles to documented rPET supply

PC-TN-001 / Version 0.1 / 07 May 2026

Poly Cleaner LLC (Poly Cleaner MMC) produces hot-washed rPET flakes from post-consumer PET bottles at Balakhani Industrial Park in Baku, Azerbaijan. Our procurement, production and shipment records support material identification and provide customers with a clear basis for product evaluation and supply coordination.

MATERIAL ORIGIN

Our feedstock consists of post-consumer PET bottles sourced through our collection and supplier network. Supplier documentation, purchase records and incoming weights support the identification of received material before sorting and processing.

PRODUCTION AND PRODUCT IDENTIFICATION

Bottles are sorted, granulated, hot-washed, separated and dried to produce clear/light-blue, green and mixed-colour rPET flakes. Production and stock records document material movement, while lot references and individual big-bag identifiers support finished-product identification.

QUALITY INFORMATION

Samples and laboratory results support technical discussions and product qualification. Bag and load references connect recorded quality results with the material evaluated. Customer-specific specifications, sampling and testing requirements are agreed during order preparation.

SHIPMENT DOCUMENTATION

The packing list identifies the supplied material, package quantities and shipment weights. Commercial invoices, transport documents and export records complete the shipment documentation. These references help customers reconcile deliveries and raise any product queries against the relevant shipment.

CUSTOMER SUPPORT

Our team works with customers to align product specifications and documentation requirements before supply. Supporting traceability information can be provided on request within an agreed scope, with commercially sensitive information handled confidentially.

Discuss your material and documentation requirements with our sales team.
